

PRESENTATION GARAGE

PDF Demo

Five slides, one folder, nothing to render at runtime

Delete this folder once you have your own presentations

How a presentation works

- One folder under presentations/ with an index.html.
- Here index.html is a pdf.js viewer; the slides live in slides.pdf.
- Design is baked into the PDF, so there is no CSS to ship.
- task manifest picks the folder up for the landing page.

Different from reveal.js: no fragments, no speaker notes — a PDF page is all-or-nothing.

Two columns

Online

GitHub pages serves the repository as-is. Push to your published branch and the viewer streams the PDF.

Offline

Nothing to bundle: hand someone slides.pdf and any reader on earth opens it.

Code and math

```
python3 slides.py      # re-render this presentation
task serve             # local garage at :8000
```

$$\text{slides} = \text{content} \times \text{contrast}^2$$

Different from reveal.js: syntax highlighting and KaTeX run at export time, not in the browser.

Your turn

Drop any exported PDF next to an index.html — Beamer, Keynote, this script
